## Abstract

---

Soil, sludge, and ash samples taken from Range-16 (R-16) on Spesutie Island, Aberdeen Proving Ground (APG), were analyzed by pyrolysis-GC-FTIR-MS. The objective of the investigation was to identify toxic combustion/pyrolysis products that may have been responsible for physical discomfort and muscle spasms experienced by range personnel who attempted to extinguish a fire, which occurred on the range on 16 March 1995. It was found that the sludge samples generate small quantities of many cyclic and noncyclic hydrocarbons, including benzene, toluene, phenol, and acetaldehyde. The most interesting and potentially important finding of this investigation was that sludge samples from both R-16 and Phillips Air Field (PAF) contain the dodecyl ester of acrylic acid [ $\text{CH}_2\text{CHCOO}(\text{CH}_2)_{11}\text{CH}_3$ ]. Toxicity data for a related ester suggests that the material is moderately toxic, a fire hazard, and emits acrid smoke when heated to decomposition. Based on a limited survey of the literature, it does not appear that esters of acrylic acid should be present in sludge.

INTENTIONALLY LEFT BLANK.

## 1. BACKGROUND

In March 1995, a fire occurred on the grounds of a U.S. Army Research Laboratory (ARL) firing range at Aberdeen Proving Ground (APG). The fire differed from other fires that occasionally break out among dry vegetation surrounding the range in that it was reportedly very difficult to extinguish and appeared to repeatedly reignite over a several-day period subsequent to the initial fire. It also differed from previous fires in that the area surrounding the range contained not only the "usual" vegetation but also dried sewage sludge that had been applied to the grounds. Range personnel involved in extinguishing the fire reported physical discomfort, including muscle spasms and skin irritation. The Risk Management office of ARL arranged for chemical analysis of the soil and sludge to be performed by an outside laboratory, but also wanted to have analysis of the pyrolysis/combustion products of sludge and soil samples performed in-house (by the Chemical Characterization Team of the Ignition and Combustion Branch [CCT/ICB]). It was agreed that this analysis would be performed by means of pyrolysis/combustion-GC-MS-FTIR (gas chromatography-mass spectrometry-Fourier transform infrared [IR]) spectroscopy.

The CCT was provided no information regarding the content of the sludge that was delivered for analysis, other than the description written on the label for each sample (see Table 1), and being told that the sewage had been treated prior to having been applied to the ground surrounding Range-16 (R-16).

Table 1. Samples Provided for Analysis

Designation	Sample	Description
1	Soil	R-16, unburned, no sludge

<sup>a</sup> Delivered to CCT/ICB on 28 April 1995.

## 2. EXPERIMENTAL

**2.1 Sample Preparation.** Samples were analyzed in two forms: 1) as received, and 2) after acetone extraction (extracts were also analyzed). Extractions were performed by placing approximately 20 mg of sewage sample in approximately 2-mL acetone. After mixing the sample for approximately 2 min, the solution was filtered through a 2- $\mu$ m polytetrafluoroethylene (PTFE) filter and collected for further analysis. After complete evaporation of the acetone from the extracted solution, a yellowish, waxy solid material was obtained. (The extract was allowed to dry under atmospheric conditions.) After having analyzed the extracts of the R-16 and Phillips Air Field (PAF) samples, and having obtained unexpected results, a second set of samples was extracted and filtered as described previously. After 1 day, the samples were observed to be viscous fluids. Analysis indicated that no residual acetone was present in the samples.

**2.2 Instrumentation.** With Pyrolysis-Gas Chromatography-Fourier Transform Infrared (Spectroscopy)-Mass Spectroscopy (P-GC-FTIR-MS), the pyrolysis products of a sample are rapidly generated and passed through a GC column, where they are then separated based on their affinity for the column's stationary phase. After passing through infrared and mass spectrometric detectors, identification of the analyte may be obtained. A schematic representation of the apparatus is given in Figure 1. In all but one case, the mass spectrometer was the detector of choice because of its greater sensitivity.

Pyrolysis was achieved by means of a CDS Model 122 Pyroprobe (coil-type probe). Approximately 2 mg of each sample were placed in quartz tubes that fit within the coils of the pyroprobe. A plug of glass wool at one end held the sample in place. The pyroprobe was connected via a heated interface chamber to the splitless injector of a Hewlett Packard (HP) 5980 GC. The GC column was, in turn, connected in parallel to the light pipe of a HP 5965 IRD dedicated infrared detector (with a narrow band mercury-cadmium-telluride [MCT] detector) and a HP 5970 MSD dedicated mass spectrometric detector.

The GC column used was a Quadrex capillary column (0.32 mm  $\times$  25 m) with a stationary phase composed of a 3- $\mu$ m OV-17 film. The temperature program used was as follows: 50° C for 3 min, and then 50–250° C at 20°/min. The GC injector and pyroprobe interface chamber were held at 200° C and 150° C, respectively. The temperature of transfer lines to the infrared detector (IRD) and mass spectroscopy detector (MSD) were held at 200° C, as was the IRD light pipe. The flow rate of the carrier gas (ultrahigh purity [UHP] helium) was 40 mL/min. Although carrier gas was continuously swept

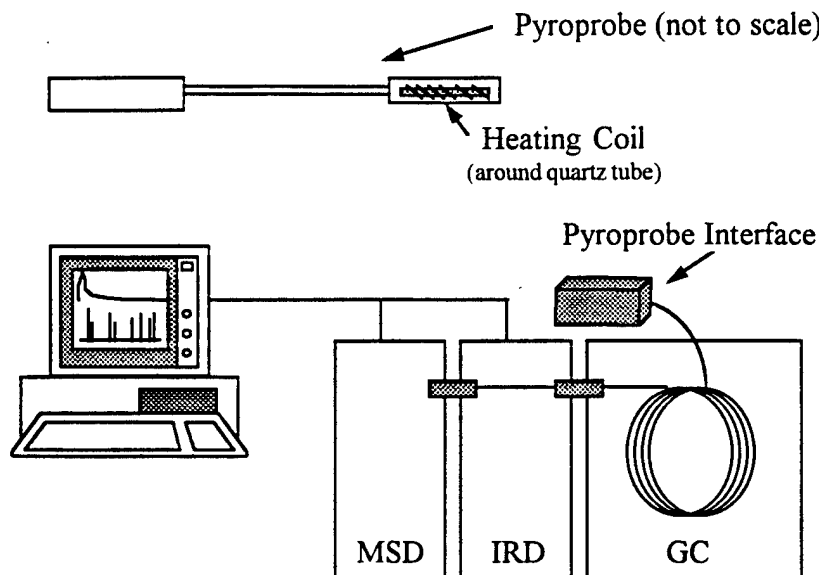

Figure 1. Experimental apparatus.

through the pyroprobe interface, a small amount of air was present during the pyrolysis, due to air trapped in the porous sample and to air entering the system when the pyroprobe is introduced into the interface chamber.

**2.3 IRD Conditions.** Three interferograms per second were continuously collected at  $8\text{ cm}^{-1}$  resolution during the chromatographic run. Real-time chromatograms (IR response vs. time) were recorded via application of the Gram-Schmidt algorithm (Griffiths and de Haseth 1986).

All functions were controlled by means of HP software running on a HP 486 Vectra PC. Manipulation of FTIR data was performed using Grams386 software.

Online searches of IR spectra were performed using the Sadtler software/database, which contains in excess of 85,000 IR spectra. Searches of mass spectra were performed using HP software and the National Bureau of Standards (NBS) database, which contains in excess of 75,000 spectra.

**NOTE:** Although it was initially agreed that both combustion and pyrolysis experiments would be performed on the sludge samples, it was determined that the sludge samples did not ignite when in contact

with the hot wire ignitor used in the CCT/ICB combustion chamber. For this reason, only pyrolysis experiments were performed.

### 3. RESULTS

Although CCT/ICB was provided with 10 samples for analysis, emphasis was quickly shifted away from the samples of soil and burned sludge and towards the unburned sludge samples from R-16 and PAF, also located at APG. This shift in emphasis resulted primarily from the observation (based on chemical analysis) that neither the soil samples nor the burned sludge samples contained materials of interest. Organic matter in the soil sample was composed primarily of cellulose-based material. The burned sludge samples were sufficiently decomposed to yield little organic matter. The PAF sample was analyzed to provide material for comparison with the unburned R-16 samples.

For documentation purposes, the gas chromatogram of the pyrolysis products of the unburned soil sample is given in Figure 2. The large peak near the 1-min mark is assigned to water. The much smaller peaks between the 5- and 10-min marks are due to acetic acid and furan carboxaldehyde (suspected to be products of cellulose pyrolysis). Since the analysis of the sludge ash sample showed no observable peaks, its chromatogram is not shown here.

Results from the pyrolysis of the unburned R-16 sludge sample at 500° C are shown in Figure 3. The observed peaks may be broken down into two groups (i.e., those eluting between 0 and 2 min, and those eluting between 8 and 16 min). The four peaks in the first group are assigned to air trapped while introducing the pyroprobe into the interface chamber, air trapped in the porous sludge sample, water, and what appears to be acetaldehyde, respectively. Acetaldehyde is a flammable liquid having a boiling point of 21° C, and therefore not expected to have been present in the sample prior to pyrolysis (since it would have vaporized and escaped from the sample prior to analysis). The second group of peaks in Figure 3 has mass spectra that are typical of cyclic and polycyclic hydrocarbons, and noncyclic hydrocarbons of moderate chain length (i.e., less than C<sub>20</sub>). A list of some of the pyrolysis products observed when a sludge sample is given a 500° C pulse is given in Table 2. A list of products observed when the same sample is given a subsequent 1,000° C pulse is also given.

Analysis of the PAF sludge sample gives results (Figure 4) that are strikingly similar to those of the R-16 sludge sample. This suggests that it is unlikely that the R-16 sludge was contaminated unless the PAF sample was *also* contaminated in the same fashion.

Figure 2. Pyrolysis-GC-MS results for R-16 soil sample containing no sludge (600° C pulse).

Figure 3. Pyrolysis-GC-MS results for R-16 sludge sample (500° C pulse).

Table 2. Products From Pyrolysis of R-16 Sludge Samples

Pyrolysis Products (500° C Pulse)	Pyrolysis Products (1,000° C Pulse)
Acetaldehyde	Acetaldehyde
3-Methyl-nonane	Toluene
Dodecanol	Benzene
Dodecene <sup>a</sup>	Styrene
2,6,11-Trimethyldodecane <sup>a</sup>	Ethylbenzene
2-Hexyl-1-decanol <sup>a</sup>	Pyrrole
Hydrocarbon <sup>b</sup>	Phenol
Hydrocarbon <sup>b</sup>	2-Methyl Phenol
Hydrocarbon <sup>b</sup>	1,3,5,7-Cyclooctatetraene <sup>a</sup>
Hydrocarbon <sup>b</sup>	5-Methyl-2-furan carboxaldehyde
Hydrocarbon <sup>b</sup>	Naphthalene
Hydrocarbon <sup>b</sup>	1,7-Octadiyne <sup>a</sup>

<sup>a</sup> Fair agreement with library search results.

<sup>b</sup> Poor agreement with specific library search results, but pattern is consistent with a hydrocarbon chain of moderate length.

Pyrolysis of both the R-16 and PAF samples in air (at 500° C, in a quartz tube) resulted first in the generation of moisture, and then a white smoke. Deposits of a waxy material on the ends of the quartz tube were observed when the tube cooled. The odor of the pyrolysis products was sickening to the stomach.

Acetone extracts of the R-16 and PAF samples were obtained, dried under atmospheric conditions, and then analyzed by Desorption-GC-FTIR-MS. Since samples were pulsed at only 250° C, the process is designated as "desorption" rather than "pyrolysis." The intention of these experiments was to determine the identity of the extracted material, rather than of the pyrolysis products of the extracted material. The results obtained from the extracts of the R-16 and PAF samples indicate that they are essentially identical (see Figures 5 and 6). An online search of the FTIR spectrum of the extract indicates with fairly high certainty (match quality = 963/1,000) that the extract is the dodecyl ester of acrylic acid (DEAA) (compare

Figure 4. Pyrolysis-GC-MS results for PAF sludge sample (400° C pulse).

Figure 5. GC-MS results for acetone extract of R-16 sludge sample (250° C pulse). Sample allowed to dry under atmospheric conditions.

Figure 6. GC-MS results for acetone extract of PAF sludge sample (250° C pulse). Sample allowed to dry under atmospheric conditions.

Figures 7b and 7c). (Note that the IR spectrum for a specific compound is unique to that compound, i.e., it is highly unlikely that any two organic compounds possess IR spectra identical in both the position and intensity of the peaks.) An online search of the mass spectrum of the material indicates with much lower certainty (match quality = 510/1,000) that the material is dodecene (see Figure 8). Although these results appear to be contradictory, they are not. A name search of the MS database failed to retrieve DEAA, meaning that it would be impossible for DEAA to be identified in a spectral search. The fact that the search retrieved dodecene, which is structurally similar to DEAA, is consistent with the IR results.

A second set of acetone extracts was obtained from both the R-16 and PAF samples. These extracts were allowed to dry for only 1 day before being analyzed by GC-FTIR-MS. Results of these analyses are shown in Figure 9. The mass spectra indicate that, although the samples still appeared to be wet, there was no acetone in the sample; the amount of water in the sample was not significantly greater than in any nonextracted samples. This observation suggests that the sample was "wet" because it contained components other than water or acetone, which are liquids at room temperature. The melting point of DEAA could not be located in the literature, but based on observations of the state of the DEAA extracted from the sludge samples (i.e., a waxy solid, as discussed previously), it is safe to say that DEAA is a solid at room temperature. Considering that the extracts are "wet" after being allowed to dry for just 1 day (and are known NOT to contain residual acetone or water), but "dry" after being allowed to dry for 2 weeks, there are several possible scenarios:

- (1) DEAA is a product of a reaction between extracted materials, and over a 2-week period is the only detectable compound left after consumption of all reagents. (Based on a following discussion under section 4.1 and Figure 11, this is not likely to have occurred.)
- (2) Materials other than DEAA are extracted from the sludge and give rise to the broad peak between 8–16 min, but eventually evaporate from the sample. (This is possible, but difficult to confirm with limited data.)
- (3) Although extraction and filtering conditions were approximately identical for both the dry samples and the samples which had been dried for only one day, there was some difference that favored extraction of the liquid components. (This is also possible but difficult to confirm with limited data. NOTE: for the second set of extractions, the amount of dry sample used was two to three times larger than in the first set of extractions.)

Unk: AVE11\_6.ISP AVE11\_6 (11.5: 11.61) Ref. (11.08 : 11.31) of C:\HPCHEM\1\DATA\RSKMGTR16AEIR.D

Library Search Result

Figure 7. GC-FTIR results for acetone extract of R-16 sludge sample (250° C pulse). Library match obtained using Sadtler IR database.

Figure 8. Results of library search of 11.5-min peak in GC-MS chromatogram shown in Figure 6.  
Library match obtained using NBS spectral database.

Figure 9. GC-MS results for acetone extract of R-16 and PAF sludge samples (250° C pulse). Samples allowed to dry for 1 day.

The chromatograms obtained from the 500° C pyrolysis of R-16 and PAF sludge "residues" (i.e., the samples remaining after acetone extraction) show a significantly decreased intensity for the peak eluting between 8 and 16 min (Figure 10). These results suggest that DEAA is the principal material responsible for the 8–16-min peak, and further suggest that the broadness of that peak results from the generation of many reaction products of DEAA (i.e., species eluting before DEAA are decomposition products, and species eluting after DEAA are condensation products [the latter would be formed by reaction of the acrylate group]). This has not yet been confirmed.

#### 4. DISCUSSION

4.1 Background/Literature Survey. A brief survey of the literature was performed since we had little previous knowledge regarding the chemical composition of sludge. The following information was obtained.

- (1) The four major types of odorants emitted by sewage and sewage treatment plants are hydrogen sulfide [ $\text{H}_2\text{S}$ ], isovaleric acid [3-methylbutanoic acid,  $(\text{CH}_3)_2\text{CHCH}_2\text{COOH}$ ], butanethiol [n-butylmercaptan,  $\text{CH}_3(\text{CH}_2)_2\text{CH}_2\text{SH}$ ], and skatole [3-methyl-1H-indole,  $\text{C}_9\text{H}_9\text{N}$ ] (Laing et al. 1994).
- (2) About 5–10% of fecal dry matter is made up of bacteria. The remainder is mostly the residues of digestive secretions that are not reabsorbed and probably include organic solid from bile, saliva, and gastric, pancreatic, and intestinal juices (Nasset 1968).
- (3) Fecal lipids include triglycerides, mono- and diglycerides, phospholipids, glycolipids, fatty acids and fatty acid salts (soaps), sterols, and cholesterol esters. Most of the lipids arise from intestinal bacterial cells and epithelial cells that have sloughed normally from the intestinal mucosa (Tietz 1976).
- (4) The stool content of neutral fat, free fatty acids, and soaps is relatively low. The total content of fat in feces should not exceed 60 g/L. Stool contains approximately 25% dry solids, and up to 25% of this dry matter may be total lipids (Tietz 1976).
- (5) See Table 3 for a list of the fatty acids found in the human body.

Figure 10. GC-MS results for R-16 sludge sample AFTER acetone extraction (500° C pulse). Compare with Figure 3 (shows reduction in intensity of 8–16-min peak).

17

Table 3. Fatty Acids Commonly Found in the Human Body

Common Name	Systematic Name	No. of Carbons
Lauric	Dodecanoic	12
Myristic	Tetradecanoic	14
Palmitic	Hexadecanoic	16
Palmitoleic	9-Hexadecanoic	16
Stearic	Octadecanoic	18
Oleic	9-Octadecenoic	18
Linoleic	9,12-Octadecadienoic	18
Linolenic	9,12,15-Octadecatrienoic	18
$\gamma$ -Linolenic	6,9,12-Octadecatrienoic	18
Arachidonic	Eicosanoic	20
Behenic	Docosanoic	22
Lignoceric	Tetracosanoic	24

Reference: Tietz 1976.

(6) A "typical" process for sewage treatment involves (at least) the following steps:

- "clarify" an aqueous dispersion of sewage by letting materials settle to the bottom
- skim off oils and scum from the top of the dispersion
- collect the sediment
- process the sediment by either pressing it (squeezing moisture out) or directly drying it. (Note: it appears that pressing is the preferred method.)
- chemically test the sediment for metals content

- final-process material by either incineration or application to a field. (If composting, mix with soil and lime. Sludge is usually included at the 7–8% level when used as a fertilizer [Waller 1995]).

(7) At APG, a variety of physical, chemical, and biological methods are employed. The schematic diagram in Figure 11 illustrates the complete process through which the sewage is treated.

(8) In general, burning of treated sewage should not pose any "extraordinary" health risk. No fire warnings are issued to farmers on whose property sludge is applied. Two other warnings are issued: for a certain period of time, there should be no animals grazing and no vegetables growing on the applied area (Bio Grow Headquarters 1995).

Based on this brief literature/background survey, the observation of DEAA in the R-16 and PAF sludge samples does not appear to be consistent with the expected composition of sludge. It is surprising that while DEAA appears to be closely related to fatty acids commonly found in the human body (and especially to lauric acid), it could not readily have been derived from any of the fatty acids. As illustrated in Figure 12, the "dodecyl ester" part of the DEAA would have to have come from dedecanol (an alcohol). To obtain an alcohol from a carboxylic acid such as lauric acid, a reduction reaction would have to have taken place. The "textbook" reaction for reduction of alcohol to carboxylic acids involves the use of lithium aluminum hydride and anhydrous ether. It is doubtful that this or an equivalent reaction could have occurred during the sewage treatment, unless, perhaps, appropriate enzymes were present in the sludge to result in an anerobic conversion of the carboxylic acid to the alcohol.

If the DEAA were a biologically related compound present in the sludge, one would expect to observe a multitude of other biologically related compounds in the acetone extract as well. Since the DEAA alone appears to be relatively abundant in the samples, the possibility that it is naturally occurring is judged to be small. A more extensive survey of the literature would be necessary to confirm this.

**4.2 Mechanism for Generation of Pyrolysis Products in Table 2.** The products listed in Table 2, as well as many others, could be formed relatively easily by pyrolysis of DEAA. It is expected that small molecules, moderate-size molecules, and even polymers *will* form when DEAA is pyrolyzed. The mechanism for polymerization will be primarily through reaction of the double bond in the acrylate group,

Dodecanoic Acid (Lauric Acid)  
( cannot react to form Dodecyl Ester of Acrylic Acid)

Figure 12. Chemical structure of dodecyl ester of acrylic acid, a component of sludge sampled from R-16 and PAF. The reaction illustrating possible synthetic route and the reason why the compound is probably not derived from a fatty acid are also shown.

which is known to be fairly reactive (especially when heated or in the presence of radicals). Formation of polymers probably accounts for the smoke observed when acrylates, such as the 2-ethoxyethyl ester of acrylic acid (see section 4.3) and the DEAA extracted from R-16 sludge sample, are heated to decomposition. It is completely reasonable to assume that in the "soup" of hydrocarbon radicals resulting from pyrolysis of DEAA, many cyclic and noncyclic products will form.

4.3 Potential Health Hazard of the Dodecyl Ester of Acrylic Acid. Unfortunately, no information regarding the toxicity of the dodecyl ester of acrylic acid could be located. Information for acrylic acid and two acrylic acid esters is presented in the following paragraph (Sax and Lewis 1993). Of the three sets of information given, it is suspected that the last (i.e., the 2-ethylhexyl ester of acrylic acid) is the closest to the ester identified in the R-16 and PAF sludge samples. Material Safety Data Sheets for all three compounds are given in Appendix A.

*Acrylic Acid:*

CAS:	79-10-7
NIOSH:	AS 437500
DOT:	UN 2218
Molecular formula:	$C_3H_4O_2$
Molecular weight:	72.07
Melting point:	13° C
Boiling point:	141° C
Density:	1.062
Vapor pressure:	10 mm @ 39.9° C
Flash point:	130° F (OC)
Vapor density:	2.45

Properties: Liquid, acrid odor. Misc in water, benzene, alcohol, chloroform, ether, and acetone.

Toxicity: Poison by ingestion, skin contact, and intraperitoneal routes. An experimental teratogen. A skin and eye irritant. Corrosive.

*Acrylic Acid, 2-Ethoxyethyl Ester:*

CAS:	106-74-1
NIOSH:	AS 9800000
Molecular formula:	$C_7H_{12}O_3$
Molecular weight:	144.19

Toxicity: Moderately toxic by various routes. A skin and eye irritant. When heated to decomposition, it emits acrid smoke and fumes.

*Acrylic Acid, 2-Ethylhexyl Ester:*

CAS:	103-11-7
NIOSH:	AS 0855000
Molecular formula:	$C_{11}H_{20}O_2$
Molecular weight:	184.31
Boiling point:	130° C @ 50 mm
Density:	0.8869 @ 20° C
Vapor pressure:	1 mm @ 50° C
Flash point:	180° F (OC)
Vapor density:	6.35

Properties: Liquid, acrid odor. Misc in water, benzene, alcohol, chloroform, ether, and acetone.

Toxicity: Moderately toxic by various routes. A skin and eye irritant. Moderate fire hazard. When heated to decomposition, it emits acrid smoke and fumes. To fight fire, use alcohol foam, CO<sub>2</sub>, dry chemical.

NOTE: Range personnel used water to try to extinguish the R-16 fire (Herron 1995).

4.4 Relation of Results to Analysis/Modeling Reported by CHPPM. In a briefing held by the ARL Risk Management Office, the Army Center for Health Promotion and Preventive Medicine (CHPPM) presented results of their analysis/modeling of the R-16 fire. The chemical analysis of the sludge, ash, and soil samples yielded concentrations for metals (silver, arsenic, cadmium, chromium, copper, iron, mercury, molybdenum, nickel, lead, selenium, and zinc), "BTEX" (benzene, toluene, ethylbenzene, m-, p-, and o-xylene), explosives (HMX, RDX, TNT, 2,6-DNT, 2,4-DNT), and semivolatiles (phenol, 4-methyl phenol, naphthalene, fluorene, N-nitrosodiphenylamine, phenylanthrene, pyrene, and bis(2-ethylhexyl) phthalate). In modeling the airborne toxins during the R-16 fire, CHPPM assumed maximum emissions from the sludge sample (i.e., during the fire, all of the toxins in the sludge volatilized and became airborne without concomitant decomposition).

There is no reason to try to directly compare results obtained by CHPPM and ICB since the analyses performed were so different in nature. CHPPM did not analyze for materials other than those mentioned previously because their analysis of the sludge was done to specifically verify that the material should not

have been regulated as hazardous waste. Results reported here by CCT/ICB for DEAA can therefore not be confirmed based on CHPPM data.

## 5. CONCLUSIONS

- (1) The pyrolysis products of soil (without sludge) from R-16 are consistent with those of cellulose-based materials.
- (2) The pyrolysis products of sludge taken from R-16 and PAF are very similar, suggesting that if there is no contamination of the PAF sludge, then the same should be true for the R-16 sludge.
- (3) The pyrolysis products of the R-16 sludge include cyclic hydrocarbons, such as benzene, toluene, phenol, and noncyclic hydrocarbons, such as acetaldehyde and "long chain" esters.
- (4) Acetone extraction of sludge samples from both R-16 and PAF yielded what appears to be DEAA. No other species of significant concentration were observed in acetone extracts which were allowed to completely dry. Samples that were allowed to dry for only 1 day were still "wet" (but contained neither water nor acetone) and showed smaller peaks in addition to a large DEAA peak.
- (5) A correlation between the presence of the DEAA and the expected content of the sludge samples was not established.
- (6) Toxicity information for DEAA was not located. Information for a related compound (i.e., the 2-ethylhexyl ester of acrylic acid) indicates that the material:
  - (a) is moderately toxic by various routes
  - (b) is a fire hazard
  - (c) emits acrid smoke when heated to decomposition.

## **6. RECOMMENDATIONS**

- (1) APG/ARL should confirm the presence of DEAA in sludge samples applied on R-16 and PAF.**
- (2) If the presence of DEAA is confirmed, APG/ARL should work with the owner/operators of the APG sewage treatment plant to:**
  - (a) identify its source.**
  - (b) determine its toxicity.**
- (3) Further application of sludge should be postponed until recommendations (1) and (2) are implemented.**

SECTION 1. - - - - - CHEMICAL IDENTIFICATION- - - - -

PRODUCT #: 14723-0  
NAME: ACRYLIC ACID, 99%

SECTION 2. - - - - - COMPOSITION/INFORMATION ON INGREDIENTS - - - - -

CAS #: 79-10-7  
MF: C3H4O2

SYNONYMS

ACROLEIC ACID \* ACRYLIC ACID, GLACIAL \* ACRYLIC ACID, INHIBITED (DOT)  
\* ETHYLENECARBOXYLIC ACID \* GLACIAL ACRYLIC ACID \* KYSELINA AKRYLOVA  
(CZECH) \* PROPENE ACID \* PROPENOIC ACID \* 2-PROPENOIC ACID (9CI) \*  
RCRA WASTE NUMBER U008 \* UN2218 (DOT) \* VINYLFORMIC ACID \*

SECTION 3. - - - - - HAZARDS IDENTIFICATION - - - - -

LABEL PRECAUTIONARY STATEMENTS

COMBUSTIBLE (USA DEFINITION)  
FLAMMABLE (EUROPEAN DEFINITION)  
HIGHLY TOXIC (USA DEFINITION)  
TOXIC (EUROPEAN DEFINITION)  
TOXIC BY INHALATION, IN CONTACT WITH SKIN AND IF SWALLOWED.  
CAUSES BURNS.  
READILY ABSORBED THROUGH SKIN.  
IN CASE OF ACCIDENT OR IF YOU FEEL UNWELL, SEEK MEDICAL ADVICE  
IMMEDIATELY (SHOW THE LABEL WHERE POSSIBLE).  
IN CASE OF CONTACT WITH EYES, RINSE IMMEDIATELY WITH PLENTY OF  
WATER AND SEEK MEDICAL ADVICE.  
TAKE OFF IMMEDIATELY ALL CONTAMINATED CLOTHING.  
WEAR SUITABLE PROTECTIVE CLOTHING, GLOVES AND EYE/FACE  
PROTECTION.  
STENCH.

SECTION 4. - - - - - FIRST-AID MEASURES- - - - -

IN CASE OF CONTACT, IMMEDIATELY FLUSH EYES OR SKIN WITH COPIOUS  
AMOUNTS OF WATER FOR AT LEAST 15 MINUTES WHILE REMOVING CONTAMINATED  
CLOTHING AND SHOES.  
ASSURE ADEQUATE FLUSHING OF THE EYES BY SEPARATING THE EYELIDS  
WITH FINGERS.  
IF INHALED, REMOVE TO FRESH AIR. IF NOT BREATHING GIVE ARTIFICIAL  
RESPIRATION. IF BREATHING IS DIFFICULT, GIVE OXYGEN.  
IF SWALLOWED, WASH OUT MOUTH WITH WATER PROVIDED PERSON IS CONSCIOUS.  
CALL A PHYSICIAN.  
WASH CONTAMINATED CLOTHING BEFORE REUSE.  
DISCARD CONTAMINATED SHOES.

SECTION 5. - - - - - FIRE FIGHTING MEASURES - - - - -

EXTINGUISHING MEDIA

CARBON DIOXIDE, DRY CHEMICAL POWDER OR APPROPRIATE FOAM.

SPECIAL FIREFIGHTING PROCEDURES

WEAR SELF-CONTAINED BREATHING APPARATUS AND PROTECTIVE CLOTHING TO  
PREVENT CONTACT WITH SKIN AND EYES.  
COMBUSTIBLE LIQUID.

UNUSUAL FIRE AND EXPLOSIONS HAZARDS

EMITS TOXIC FUMES UNDER FIRE CONDITIONS.  
VAPOR MAY TRAVEL CONSIDERABLE DISTANCE TO SOURCE OF IGNITION AND  
FLASH BACK.  
CONTAINER EXPLOSION MAY OCCUR UNDER FIRE CONDITIONS.

SECTION 6. - - - - - ACCIDENTAL RELEASE MEASURES- - - - -

EVACUATE AREA.  
WEAR SELF-CONTAINED BREATHING APPARATUS, RUBBER BOOTS AND HEAVY  
RUBBER GLOVES.  
ABSORB ON SAND OR VERMICULITE AND PLACE IN CLOSED CONTAINERS FOR  
DISPOSAL.  
VENTILATE AREA AND WASH SPILL SITE AFTER MATERIAL PICKUP IS COMPLETE.

SECTION 7. - - - - - HANDLING AND STORAGE- - - - -

REFER TO SECTION 8.

ADDITIONAL INFORMATION

WARNING: DO NOT USE STEAM OR ELECTRICAL HEATING SYSTEMS SUCH AS COILS,

JACKETS, TAPES, MANTLES, LIGHTS, ETC. TO THAW ANY SOLIDIFIED MONOMER.  
THE APPLICATION OF CONCENTRATED HEAT WILL CAUSE POLYMERIZATION AND  
POSSIBLE RUPTURE OF THE CONTAINER. DO NOT REFRIGERATE OR FREEZE.  
INHIBITED WITH 200 PPM HYDROQUINONE MONOMETHYL ETHER (MEHQ).

SECTION 8. - - - - - EXPOSURE CONTROLS/PERSONAL PROTECTION - - - - -

WEAR APPROPRIATE NIOSH/MSHA-APPROVED RESPIRATOR, CHEMICAL-RESISTANT  
GLOVES, SAFETY GOGGLES, OTHER PROTECTIVE CLOTHING.  
SAFETY SHOWER AND EYE BATH.  
USE ONLY IN A CHEMICAL FUME HOOD.  
FACESHIELD (8-INCH MINIMUM).  
DO NOT BREATHE VAPOR.  
DO NOT GET IN EYES, ON SKIN, ON CLOTHING.  
AVOID PROLONGED OR REPEATED EXPOSURE.  
WASH THOROUGHLY AFTER HANDLING.  
HIGHLY TOXIC.  
CORROSIVE.  
KEEP TIGHTLY CLOSED.  
STENCH.  
KEEP AWAY FROM HEAT AND OPEN FLAME.  
STORE IN A COOL DRY PLACE.

SECTION 9. - - - - - PHYSICAL AND CHEMICAL PROPERTIES - - - - -

APPEARANCE AND ODOR

COLORLESS LIQUID  
BOILING POINT: 139 C  
MELTING POINT: 13 C  
FLASHPOINT 130 F  
54C  
AUTOIGNITION TEMPERATURE: 744 F 395C  
UPPER EXPLOSION LEVEL: 13.7%  
LOWER EXPLOSION LEVEL: 2%  
VAPOR PRESSURE: 4MM 20 C 40MM 60 C  
VAPOR DENSITY: 2.5  
SPECIFIC GRAVITY: 1.051

SECTION 10. - - - - - STABILITY AND REACTIVITY - - - - -

INCOMPATIBILITIES

STRONG OXIDIZING AGENTS  
STRONG BASES  
MAY UNDERGO AUTOPOLYMERIZATION.  
STORE AWAY FROM HEAT AND DIRECT SUNLIGHT.

HAZARDOUS COMBUSTION OR DECOMPOSITION PRODUCTS

TOXIC FUMES OF:  
CARBON MONOXIDE, CARBON DIOXIDE

SECTION 11. - - - - - TOXICOLOGICAL INFORMATION - - - - -

ACUTE EFFECTS

MAY BE FATAL IF INHALED, SWALLOWED, OR ABSORBED THROUGH SKIN.  
MATERIAL IS EXTREMELY DESTRUCTIVE TO TISSUE OF THE MUCOUS MEMBRANES  
AND UPPER RESPIRATORY TRACT, EYES AND SKIN.  
INHALATION MAY BE FATAL AS A RESULT OF SPASM, INFLAMMATION AND EDEMA  
OF THE LARYNX AND BRONCHI, CHEMICAL PNEUMONITIS AND PULMONARY EDEMA.  
SYMPTOMS OF EXPOSURE MAY INCLUDE BURNING SENSATION, COUGHING,  
WHEEZING, LARYNGITIS, SHORTNESS OF BREATH, HEADACHE, NAUSEA AND  
VOMITING.

SECTION 1. - - - - - CHEMICAL IDENTIFICATION- - - - -

PRODUCT #: A1915  
NAME: (+-)ACRYLIC ACID 2-ETHYLHEXYL ESTER

SECTION 2. - - - - - COMPOSITION/INFORMATION ON INGREDIENTS - - - - -

CAS #:103-11-7  
MF: C11H20O2

SYNONYMS

2-ETHYLHEXYL ACRYLATE \* 2-ETHYLHEXYLESTER KYSELINY AKRYLOVE (CZECH) \*  
2-ETHYLHEXYL 2-PROPENOATE \* 1-HEXANOL, 2-ETHYL-, ACRYLATE \* OCTYL  
ACRYLATE \* 2-PROPENOIC ACID, 2-ETHYLHEXYL ESTER (9CI) \*

SECTION 3. - - - - - HAZARDS IDENTIFICATION - - - - -

LABEL PRECAUTIONARY STATEMENTS

TOXIC  
MAY CAUSE CANCER.  
IRRITATING TO EYES, RESPIRATORY SYSTEM AND SKIN.  
MAY CAUSE SENSITIZATION BY SKIN CONTACT.  
LACHRYMATOR.  
COMBUSTIBLE.  
IN CASE OF ACCIDENT OR IF YOU FEEL UNWELL, SEEK MEDICAL ADVICE  
IMMEDIATELY (SHOW THE LABEL WHERE POSSIBLE).  
IN CASE OF CONTACT WITH EYES, RINSE IMMEDIATELY WITH PLENTY OF  
WATER AND SEEK MEDICAL ADVICE.  
WEAR SUITABLE PROTECTIVE CLOTHING, GLOVES AND EYE/FACE  
PROTECTION.  
DO NOT BREATHE VAPOR.

SECTION 4. - - - - - FIRST-AID MEASURES- - - - -

IN CASE OF CONTACT, IMMEDIATELY FLUSH EYES OR SKIN WITH COPIOUS  
AMOUNTS OF WATER FOR AT LEAST 15 MINUTES WHILE REMOVING CONTAMINATED  
CLOTHING AND SHOES.  
ASSURE ADEQUATE FLUSHING OF THE EYES BY SEPARATING THE EYELIDS  
WITH FINGERS.  
IF INHALED, REMOVE TO FRESH AIR. IF NOT BREATHING GIVE ARTIFICIAL  
RESPIRATION. IF BREATHING IS DIFFICULT, GIVE OXYGEN.  
IF SWALLOWED, WASH OUT MOUTH WITH WATER PROVIDED PERSON IS CONSCIOUS.  
CALL A PHYSICIAN.  
WASH CONTAMINATED CLOTHING BEFORE REUSE.  
DISCARD CONTAMINATED SHOES.

SECTION 5. - - - - - FIRE FIGHTING MEASURES - - - - -

EXTINGUISHING MEDIA

CARBON DIOXIDE, DRY CHEMICAL POWDER OR APPROPRIATE FOAM.  
WATER SPRAY.

SPECIAL FIREFIGHTING PROCEDURES

WEAR SELF-CONTAINED BREATHING APPARATUS AND PROTECTIVE CLOTHING TO  
PREVENT CONTACT WITH SKIN AND EYES.  
COMBUSTIBLE LIQUID.

UNUSUAL FIRE AND EXPLOSIONS HAZARDS

EMITS TOXIC FUMES UNDER FIRE CONDITIONS.

SECTION 6. - - - - - ACCIDENTAL RELEASE MEASURES- - - - -

EVACUATE AREA.  
WEAR SELF-CONTAINED BREATHING APPARATUS, RUBBER BOOTS AND HEAVY  
RUBBER GLOVES.  
WEAR DISPOSABLE COVERALLS AND DISCARD THEM AFTER USE.  
COVER WITH DRY LIME OR SODA ASH, PICK UP, KEEP IN A CLOSED CONTAINER  
AND HOLD FOR WASTE DISPOSAL.  
VENTILATE AREA AND WASH SPILL SITE AFTER MATERIAL PICKUP IS COMPLETE.

SECTION 7. - - - - - HANDLING AND STORAGE- - - - -

REFER TO SECTION 8.

ADDITIONAL INFORMATION

INHIBITED WITH 10 PPM HYDROQUINONE MONOMETHYL ETHER (MEHQ) OR 10 PPM  
HYDROQUINONE. DO NOT TRANSFER OR STORE UNDER AN INERT ATMOSPHERE  
BECAUSE AUTOPOLYMERIZATION MAY OCCUR. FIRE FIGHTING: THE USE OF WATER  
STREAMS FOR FIGHTING LARGE SCALE FIRES PRODUCES A FLOATING FIRE DUE  
TO THE MATERIAL'S INSOLUBILITY IN WATER.

SECTION 8. - - - - - EXPOSURE CONTROLS/PERSONAL PROTECTION- - - - -  
WEAR APPROPRIATE NIOSH/MSHA-APPROVED RESPIRATOR, CHEMICAL-RESISTANT  
GLOVES, SAFETY GOGGLES, OTHER PROTECTIVE CLOTHING.  
USE ONLY IN A CHEMICAL FUME HOOD.  
SAFETY SHOWER AND EYE BATH.  
DO NOT BREATHE VAPOR.  
DO NOT GET IN EYES, ON SKIN, ON CLOTHING.  
WASH THOROUGHLY AFTER HANDLING.  
CARCINOGEN.  
IRRITANT.  
LACHRYMATOR.  
SENSITIZER.  
KEEP TIGHTLY CLOSED.  
KEEP AWAY FROM HEAT AND OPEN FLAME.  
HEAT- AND LIGHT-SENSITIVE.  
REFRIGERATE.

SECTION 9. - - - - - PHYSICAL AND CHEMICAL PROPERTIES - - - - -  
APPEARANCE AND ODOR  
COLORLESS LIQUID  
BOILING POINT: 215 C TO 219 C  
FLASHPOINT 175 F  
79C  
UPPER EXPLOSION LEVEL: 6.4%  
LOWER EXPLOSION LEVEL: 0.8%  
VAPOR PRESSURE: 0.15MM 20 C  
VAPOR DENSITY: 6.4  
SPECIFIC GRAVITY: 0.885

SECTION 10. - - - - - STABILITY AND REACTIVITY - - - - -  
INCOMPATIBILITIES  
STRONG OXIDIZING AGENTS  
MAY POLYMERIZE ON EXPOSURE TO LIGHT.  
HEAT-SENSITIVE.  
STRONG ACIDS  
STRONG BASES

HAZARDOUS COMBUSTION OR DECOMPOSITION PRODUCTS  
TOXIC FUMES OF:  
CARBON MONOXIDE, CARBON DIOXIDE

SECTION 11. - - - - - TOXICOLOGICAL INFORMATION - - - - -  
ACUTE EFFECTS  
HARMFUL IF SWALLOWED, INHALED, OR ABSORBED THROUGH SKIN.  
VAPOR OR MIST IS IRRITATING TO THE EYES, MUCOUS MEMBRANES AND UPPER  
RESPIRATORY TRACT.  
CAUSES SKIN IRRITATION.  
SYMPTOMS OF EXPOSURE MAY INCLUDE BURNING SENSATION, COUGHING,  
WHEEZING, LARYNGITIS, SHORTNESS OF BREATH, HEADACHE, NAUSEA AND  
VOMITING.  
MAY CAUSE ALLERGIC SKIN REACTION.

CHRONIC EFFECTS  
CARCINOGEN.  
TO THE BEST OF OUR KNOWLEDGE, THE CHEMICAL, PHYSICAL, AND  
TOXICOLOGICAL PROPERTIES HAVE NOT BEEN THOROUGHLY INVESTIGATED.

RTECS NO: AT0855000

13. ABSTRACT (Maximum 200 words)  Soil, sludge, and ash samples taken from Range-16 (R-16) on Spesutie Island, Aberdeen Proving Ground (APG), were analyzed by pyrolysis-GC-FTIR-MS. The objective of the investigation was to identify toxic combustion/pyrolysis products that may have been responsible for physical discomfort and muscle spasms experienced by range personnel who attempted to extinguish a fire, which occurred on the range on 16 March 1995. It was found that the sludge samples generate small quantities of many cyclic and noncyclic hydrocarbons, including benzene, toluene, phenol, and acetaldehyde. The most interesting and potentially important finding of this investigation was that sludge samples from both R-16 and Phillips Air Field (PAF) contain the dodecyl ester of acrylic acid [ $\text{CH}_2\text{CHCOO}(\text{CH}_2)_{11}\text{CH}_3$ ]. Toxicity data for a related ester suggests that the material is moderately toxic, a fire hazard, and emits acrid smoke when heated to decomposition. Based on a limited survey of the literature, it does not appear that esters of acrylic acid should be present in sludge.

## USER EVALUATION SHEET/CHANGE OF ADDRESS

This Laboratory undertakes a continuing effort to improve the quality of the reports it publishes. Your comments/answers to the items/questions below will aid us in our efforts.

1. ARL Report Number/Author ARL-MR-332 (Pesce-Rodriguez) Date of Report December 1996
2. Date Report Received \_\_\_\_\_
3. Does this report satisfy a need? (Comment on purpose, related project, or other area of interest for which the report will be used.) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
4. Specifically, how is the report being used? (Information source, design data, procedure, source of ideas, etc.) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
5. Has the information in this report led to any quantitative savings as far as man-hours or dollars saved, operating costs avoided, or efficiencies achieved, etc? If so, please elaborate. \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
6. General Comments. What do you think should be changed to improve future reports? (Indicate changes to organization, technical content, format, etc.) \_\_\_\_\_
